<h1>HowtheAlsubsystemisdesigned</h1>
```

The AI subsystem isn't really complex, but it could takeawhileto understandit'sdesign.

>

All"intelligence"ishandledinsidethe <code>Al()</code> function (right now it's one bigfunctionbutwehopetosplititinthefuture).

As explained in the <a>Main loop & Damp; initializationpage, the <code>AI()</code> function only runs less thanafractionofasecond.

>

Basically, the Altells Koreto docertain things based on the current situation. I'll try to explain it with some examples.

```
<aname="ex1"></a>
<h2>Example1:Randomwalk</h2>
```

You'reprobablyfamiliarwithKore'srandomwalkfeature.

If there are no monsters and Kore isn't doing anything, it will walk to a random spot on the map, and attack anymonstersitencounters.

The following piece of code (within the <code>AI()</code>function makes Kore walk to a random spot if it isn'tdoing anything:

class="example">

- 1 ##### RANDOM WALK#####

```
!$cities_lut{$field{'name'}.'.rsw'}){
3
                <span class="comment"># Find a
                randomblock on the map that we can
                walkon</span>
                <b>do</b>{
4
5
                $ai_v{'temp'}{'randX'} = int(rand()
*($field{'width'}- 1));
                $ai_v{'temp'}{'randY'} = int(rand()
*($field{'height'} - 1));
<b>while</b>($field{'field'}[$ai_v{'temp'}{'randY'}*$field{'width'}+
$ai_v{'temp'}{'randX'}]);8
9
                <span class="comment"># Move to
                thatblock</span>
10
                message < span
                class="cstr">"Calculatingrandom routeto:
$maps_lut{$field{'name'}.'.rsw'}($field{'name'}):
ai_v{\text{'temp'}}{\text{'rand}X'}, ai_v{\text{'temp'}}{\text{'rand}Y'}\n"</span>,
<spanclass="cstr">"route"</span>;
                ai_route(\% {\ai_v{'temp'}}{'returnHash'}),
11
12
                $ai_v{'temp'}{'randX'},
13
                $ai_v{'temp'}{'randY'},
14
                $field{'name'},
15
                0,
16
                $config{'route_randomWalk_maxRouteTime'},
17
                2,
                undef,
18
                undef,
19
20
                1);
21
                }
```

We call this block of code an <em class="term">Al codeblock.

In other words, an AI code block is an entire blockofcodewhichdealswithacertainpartof theAI.

<h3>Situation

check</h3>Inline1, it

checks:

< 0 |>

whethertheconfigurationoption

<code>route_randomWalk</code>ison

whether there are currently no other active

<emclass="term">Alsequences/em>(seebelow)

whetherwe'recurrentlyNOTinacity

</0|>

If all of the above is true, then Kore will run the codeinside thebrackets.

>

What is an <em class="term">AI sequence? It is avaluewithinthe<code>@ai_seq</code> array.

Thisarrayisacommandqueue.

>

Al code blocks prepend values into this array so they canknowwhen it'stheir turn to do something.

When an AI code block is done with it's task, it willremove thatvaluefrom thearray.

So, if <code>@ai_seq</code> is empty, then that means allAI code blocks have finished and Kore isn't doinganythingelse.

AndthisiswhentherandomwalkAlcodeblock jumpsin.

>

There is also the <code>@ai_seq_args</code> array, used to store temporary variables used by the current Al codeblock.

If a value is prepended into <code><code>@ai_seq</code></code>, then a value mustalsobe prepended into

<code>@ai_seq_args</code>.Mo

reonthislater.

<h3>Findingarandompositiontowalkto</h3>

Line 4-7 tries to find a random position in the map thatyoucanwalkon.

(<code>\$field{field}</code> is a reference to an arraywhichcontainsinformationaboutwhichblocksyoucanandcan't walkon.

But that's not important in this example. You just havetounderstand what thisblockdoes.)

>

The result coordinate is put into the set wo variables:

<code>\$ai_v{temp}{randX}</code>

<code>\$ai_v{temp}{randY}</code>

```
<small>(In case you didn't know,
<code>$foo{bar}</code>isthesameas<code>$foo{'bar'}</code
>.)</small>
```

<h3>Moving</h3>

Line 11- 20 is the code which tells Koretomove to the random position.

Ittells<code>ai_route()</code>whereitwants togoto.

<code>ai_route()</code> prepends a <code>"route"</code>Al
sequence in <code>@ai_seq</code>, and arguments in ahash

(which is then prepended into <code>@ai_seq_args</code>andimmediatelyreturns.

Shortly after this, the entire <code>AI()</code> functionreturns.

The point is, <code>ai_route()</code> is notsynchronous.

>

Inlessthanafractionofasecond, the <code>AI()</code>functioniscalledagain.

Because the <code>@ai_seq</code> variable is not emptyanymore,therandomwalkAlcodeblockisnever activated (the expression <code>'\$ai_seq[0] eq ""'</code> isfalse).

>

The AI code block that handles routing is elsewhere inthe<code>AI()</code>function.

Itseesthatthefirstvaluein<code>@ai_seq</code>is <code>"route"</code>,andthinks"hey,nowit'smyturntodo something!".

(The route AI code block is very complex so I'm not goingtoexplain whatitdoes, butyougettheidea.)

When the route AI code block has finished, it will remove the first item from < code > @ai_seq < /code >.

If <code>@ai_seq</code> is empty, then the random routeAlcodeblock isactivatedagain.

<h2>Example 2: Attacking monsters while walking to arandom spot</h2>

YoumightwanttowonderhowKoreisabletodeterminewhetherto attack monsterswhenit'swalking.

Let'stakealook atasmallpiece ofit'ssourcecode:

```
|| $ai_seq[0] <b>eq</b>
<spanclass="cstr">"sitAuto"</span>||$ai_seq[0]<b>eq</b>
<spanclass="cstr">"take"</span>||$ai_seq[0]<b>eq</b>
<spanclass="cstr">"items_gather"</span>||$ai_seq[0]
<b>eq</b><spanclass="cstr">"items_take"</span>)
```

• • •

As you can see here, the auto- attack AI code block is runifany of theaboveAI sequences are active.

So when Kore is walking (<code>\$ai_seq_args[0]</code> is"route"), Korecontinuestocheckformonsterstoattack.

>

But a syou may know, if you manually type "move Whate Ever Map Name" in the console, Korewill move to that map without attacking

monsters (yes, this is intentional behavior). Why isthat?

>

As seen in example 1, the <code>ai_route()</code>functioninitializesthe routeAlsequence.

Thatfunctionacceptsaparametercalled"attackOnRoute". <code>\$ai_seq_args[0]{attackOnRoute}</code> is set to the same value as this parameter.

Kore will only attack monsters while moving, if that parameter is set to 1.

Whenyoutype"move"intheconsole,thatparameterissetto 0. The random walk AI code block however sets thatparameter to 1.

>

Inside the auto- attack AI code block, Kore checks whetherthe argument hash that's associated with the "route" Alsequencehasa

'attackOnRoute'key,andwhetherthevalueis1.

class="example">

...

\$ai_v{'temp'}{'ai_route_index'}=binFind(\@ai_seq,
<spanclass="cstr">"route");

In certain cases you may want the program to wait a whilebefore doinganythingelse.

<h2>Timeouts:Towaita whilebeforedoingsomething</h2>

Forexample, you may want to send a "talk to NPC" packet to the server, the nsend a "choose NPC menuitem 2" packet 2 second slater.

```
>
```

Thefirstthingyouwouldthinkof isprobably tousethe <code>sleep()</code>function.

However, that is a bad idea. <code>sleep()</code> blocksthe entire program. During the sleep, nothing else can beperformed.

User command input will not work, other AI sequences arenotrun, networkdata is not received, etc.

```
<ahref="Utils.html#timeOut"><code>timeOut()</code></a>function.
The API documentation entry for that function has
two examples. Here's another example, demonstrating how
                         timeOut()
you
      can
             use
                   the
                                     function
                                                in
                                                     an
                                                          ΑI
sequence. This example initializes a conversation with NPC 1337 (a Ka
pra NPC).
Then two seconds later, it sends a "choose NPC menu
item2"packet.
class="example">
<span class="comment"># The AI() function is run in
themainloop</span>
<b>sub</b>Al{
        <b>if</b>($somethingHappened){
                 <b>my</b>% args;
                     $args{stage}=<spanclass="cstr">'Just
 started'</span>;
                 <b>vnshift</b> @ai_seq,

#

Twosecondshavenowpassed

sendTalkResponse(\$net,1337,2);

#

We'redone; removethis Alsequence

```
<b>shift</b>@ai_seq;
                         <b>shift</b>@ai_seq_args;
                 }
        }
}
<h2>Conclusion&amp;summary</h2>
The entire AI subsystem is kept together by these
twovariables:
<code>@ai_seq</code> : a queue which contains
Alsequencenames.
Usually, AI code blocks are run based on the value of thefirst
itemin thequeue
(though this doesn't have to be true; it depends on howtheAI
codeblockisprogrammed).
<code>@ai_seq_args</code> : contains arguments
that'sassociated withcurrentAlsequence.
The design is pretty simple. This allows the system to
beveryflexible:
you can do pretty much anything you want. There
aren'tmanyreallimitations
(butthat'sjustmyopinion).
```

The <code>AI()</code> function runs only very shortly. SoAI code blocks shouldn't do anything that can block thefunctionforalongtime.
